

# Package ‘Cluster.OBeu’

January 25, 2018

**Type** Package

**Title** Cluster Analysis OpenBudgets.eu

**Version** 1.2.1

**Date** 2017-10-30

**Description** Estimate and return the needed parameters for visualizations designed for OpenBudgets.eu <<http://openbudgets.eu/>> datasets. Calculate cluster analysis measures in Budget data of municipalities across Europe, according to the OpenBudgets.eu data model. It involves a set of techniques and algorithms used to find and divide the data into groups of similar observations. Also, can be used generally to extract visualization parameters convert them to JSON format and use them as input in a different graphical interface.

**Maintainer** Kleanthis Koupidis <[koupidis.okfgr@gmail.com](mailto:koupidis.okfgr@gmail.com)>

**URL** <https://github.com/okgreece/Cluster.OBeu>

**BugReports** <https://github.com/okgreece/Cluster.OBeu/issues>

**License** GPL-2 | file LICENSE

**Encoding** UTF-8

**LazyData** TRUE

**Imports** car, cluster, clValid, data.tree, dendextend, graphics, jsonlite, mclust, RCurl, reshape, reshape2, stringr, tibble, utils, methods

**RoxygenNote** 6.0.1

**Author** Kleanthis Koupidis [aut, cre],  
Charalampos Bratsas [aut],  
Jaroslav Kuchar [ctb]

--------------	----------

---

cl.analysis	Cluster analysis
-------------	------------------

---

### Description

Clustering Analysis for OBEU datasets.

### Usage

```
cl.analysis(cl.data, cl_feature = NULL, amount = NULL, cl.aggregate = "sum",  
cl.meth = NULL, clust.numb = NULL, dist = "euclidean", tojson = FALSE)
```

### Arguments

cl.data	The input data
cl_feature	The feature to be clustered (nominal variables)
amount	The numeric variables
cl.aggregate	Select a different aggregation in case of filtering the input data
cl.meth	The clustering method algorithm
clust.numb	The number of clusters
dist	The distance metric
tojson	If TRUE the results are returned in json format, default returns a list

### Details

There are different clustering models to be selected through an evaluation process. The user should define the `cl_feature`, `cl.aggregate` and `amount` parameters to form the structure of cluster data. The clustering algorithm, the number of clusters and the distance metric of the clustering model are set to the best selection using internal and stability measures. The end user can also interact with the cluster analysis and these parameters by specifying the `cl.method`, `cl.num` and `cl.dist` parameters respectively.

### Value

The final returns are the parameters needed for visualizing the cluster data depending on the selected algorithm and the specification parameters, as long as some comparison measure matrices.

- `cluster.method` - Label of the clustering algorithm
- `raw.data` - Input data
- `data.pca` - The principal components to visualize the input data
- `modelparam` - The results of this parameter depend of the selected clustering model
- `compare` - Clustering measures

### Author(s)

---

cl.features	<i>Clustering features</i>
-------------	----------------------------

---

**Description**

Select clustering characteristic to form the clustering data

**Usage**

```
cl.features(data, features = NULL, amounts = NULL, aggregate = "sum", tojson = FALSE )
```

**Arguments**

data	The input data
features	The clustering features
amounts	The amount measures of the dataset
aggregate	The function to aggregate
tojson	If TRUE the results are returned in json format, default returns a list

**Details**

This function adapts the dataset according to the selected dimension of the dataset and the aggregation function.

**Value**

This function returns the dataset for cluster analysis adapted to the desired features.

[cl.analysis](#)

---

cl.plot	<i>Clustering model plotting</i>
---------	----------------------------------

---

**Description**

cl.plot function plots the clustering model constructed by the [cl.analysis](#) function.

**Usage**

```
cl.plot(clustering.model, parameters = list())
```

**Arguments**

- `clustering.model` Object returned by the [cl.analysis](#) function.
- `parameters` List of parameters to indicate plotting of ellipses or convex hulls. Default values: `list(ellipses=FALSE, convex.hulls=FALSE)`.

[cl.analysis](#)

**Examples**

```
library(Cluster.OBeu)
inputs.clustering <- cl.analysis(sample_city_data, cl.meth="kmeans", clust.numb=3)
cl.plot(inputs.clustering, parameters = list(ellipses=TRUE))
```

---

<code>cl.summary</code>	<i>Extract the proposed clustering method and the number of clusters from clvalid method</i>
-------------------------	--

---

**Description**

Extract the most frequent

**Usage**

```
cl.summary(clv)
```

**Arguments**

- `clv` A `clValid` object

**Details**

This function returns the proposed method or number of clusters or both according to the majority clustering indices of a `clValid` process

**Value**

A value that indicates the proposed method and number of clusters.

**Author(s)**

Kleanthis Koupidis

---

nums	<i>Select the numeric columns of a given dataset</i>
------	--

---

**Description**

Extract and return a data frame with the columns that include only numeric values

**Usage**

```
nums(data)
```

**Arguments**

data                      The input data frame, matrix

**Value**

This function returns a data frame with the numeric columns of the input dataset.

**Author(s)**

Kleanthis Koupidis

---

open_spending.cl	<i>Read and Calculate the Basic Information for Cluster Analysis Tasks from Open Spending API</i>
------------------	---

---

**Description**

Extract and analyze the input data provided from Open Spending API, using the [cl.analysis](#) function.

**Usage**

```
open_spending.cl(json_data, dimensions=NULL, amounts=NULL, measured.dimensions=NULL,
cl.aggregate="sum", cl.method=NULL, cl.num=NULL, cl.dist="euclidean")
```

**Arguments**

json\_data                The json string, URL or file from Open Spending API

dimensions               The dimensions/feature of the input data

amounts                  The measures of the input data

measured.dimensions     The dimensions to which correspond amount/numeric variables

cl.aggregate             Aggregate function of the input data

cl.method                The clustering algorithm

cl.num                   The number of clusters

cl.dist                   The distance metric

**Details**

This function is used to read data in json format from Open Spending API, in order to implement cluster analysis through [cl.analysis](#) function.

**Value**

A json string with the resulted parameters of the [cl.analysis](#) function.

---

sample\_city\_data

*Sample city data*

---

**Description**

This dataset is an example data frame of the budget phase data

- Administrative\_Unit
- Approved
- Draft
- Executed
- Revised

**Format**

A data frame with the previous characteristics as columns
