| | |
|-------------|---------------------|
| cl.analysis | <i>Cluster OBEU</i> |
|-------------|---------------------|

Description

Clustering Analysis for OBEU datasets.

Usage

```
cl.analysis(cl.data, cl_feature=NULL, amount=NULL, cl.aggregate="sum",  
cl.meth=NULL, clust.numb=NULL, dist="euclidean")
```

Arguments

| | |
|--------------|--|
| cl.data | The input data |
| cl_feature | Select a subset of the input data |
| amount | The numeric |
| cl.aggregate | Select a different aggregation in case of filtering the input data |
| cl.meth | The clustering method algorithm |
| clust.numb | The number of clusters |
| dist | The distance metric |

Details

There are different clustering models to be selected through an evaluation process. The user should define the dimensions, measured.dim and amount parameters to form the structure of cluster data. The clustering algorithm, the number of clusters and the distance metric of the clustering model are set to the best selection using internal and stability measures. The end user can also interact with the cluster analysis and these parameters by specifying the cl.method, cl.num and cl.dist parameters respectively.

Value

The final returns are the parameters needed for visualizing the cluster data depending on the selected algorithm and the specification parameters, as long as some comparison measure matrices.

- cl.meth - Label of the clustering algorithm
- clust.numb - The number of clusters
- data.pca - The principal components to visualize the input data
- modelparam - The results of this parameter depend of the selected clustering model

| | |
|-------------|----------------------------|
| cl.features | <i>Clustering features</i> |
|-------------|----------------------------|

Description

Select clustering characteristic of OBEU datasets.

Usage

```
cl.features(data, features=NULL, amounts=NULL, aggregate="sum")
```

Arguments

| | |
|-----------|------------------------------------|
| data | The input data |
| features | The clustering features |
| amounts | The amount measures of the dataset |
| aggregate | The function to aggregate |

Details

This function adapts the dataset according to the selected dimension of the dataset and the aggregation function.

Value

This function returns the dataset for cluster analysis adapted to the desired features.

[cl.analysis](#)

| | |
|---------|----------------------------------|
| cl.plot | <i>Clustering model plotting</i> |
|---------|----------------------------------|

Description

cl.plot function plots the clustering model constructed by the [cl.analysis](#) function.

Usage

```
cl.plot(clustering.model, parameters = list())
```

Arguments

`clustering.model` Object returned by the [cl.analysis](#) function.

`parameters` List of parameters to indicate plotting of ellipses or convex hulls. Default values: `list(ellipses=FALSE, convex.hulls=FALSE)`.

[cl.analysis](#)

Examples

```
#data("iris")
#inputs.data <- scale(iris[,1:4])
#inputs.clustering <- cl.analysis(inputs.data, cl.meth="kmeans", clust.numb=3)
#cl.plot(inputs.clustering, parameters = list(convex.hulls=TRUE))
```

| | |
|-------------------------|--|
| <code>cl.summary</code> | <i>Extract the proposed clustering method and the number of clusters from clvalid method</i> |
|-------------------------|--|

Description

Extract the most frequent

Usage

```
cl.summary(clv)
```

Arguments

`clv` A `clValid` object

Details

This function returns the proposed method or number of clusters or both according to the majority clustering indices of a `clValid` process

Value

A value that indicates the proposed method and number of clusters.

Author(s)

Kleanthis Koupidis

| | |
|------|--|
| nums | <i>Select the numeric columns of a given dataset</i> |
|------|--|

Description

Extract and return a data frame with the columns that include only numeric values

Usage

```
nums(data)
```

Arguments

data The input data frame

Value

This function returns a data frame with the numeric columns of the input dataset.

| | |
|------------------|---|
| open_spending.cl | <i>Read and Calculate the Basic Information for Cluster Analysis Tasks from Open Spending API</i> |
|------------------|---|

Description

Extract and analyze the input data provided from Open Spending API, using the [cl.analysis](#) function.

Usage

```
open_spending.cl(json_data, dimensions=NULL, amounts=NULL, measured.dim=NULL,
cl.aggregate="sum", cl.method=NULL, cl.num=NULL, cl.dist="euclidean")
```

Arguments

| | |
|--------------|---|
| json_data | The json string, URL or file from Open Spending API |
| dimensions | The dimensions/feature of the input data |
| amounts | The measures of the input data |
| measured.dim | The dimensions to which correspond amount/numeric variables |
| cl.aggregate | The desired aggregation of the input data |
| cl.method | The clustering method algorithm |
| cl.num | The number of clusters |
| cl.dist | The distance metric |

Details

This function is used to read data in json format from Open Spending API, in order to implement cluster analysis through [cl.analysis](#) function.

Value

A json string with the resulted parameters of the [cl.analysis](#) function.
